/ Data Structures - Splay Tree

Splay tree

◀ Previous (<https://www.wisdomjobs.com/e-university/data-structures-tutorial-290/scapegoat-tree-7216.html>)

Next ▶ (<https://www.wisdomjobs.com/e-university/data-structures-tutorial-290/t-tree-7218.html>)

A **splay tree** is a self-balancing binary search tree with the additional property that recently accessed elements are quick to access again. It performs basic operations such as insertion, look-up and removal in $O(\log(n))$ amortized time. For many non-uniform sequences of operations, splay trees perform better than other search trees, even when the specific pattern of the sequence is unknown. The splay tree was invented by Daniel Dominic Sleator and Robert Endre Tarjan in 1985.

All normal operations on a binary search tree are combined with one basic operation, called *splaying*. Splaying the tree for a certain element rearranges the tree so that the element is placed at the root of the tree. One way to do this is to first perform a standard binary tree search for the element in
